

the top end 110. The roller and pipe are operated by holding the fixed handle 114 in one hand, and operating the activation handle 116 (that moves on and along segment 104) with the other hand, in reference to the fixed handle 114. This moves segment 106 up and down through motion of straps 118 which are attached at either end to handle 116 at points 119 with the loop sliding through holes 120 formed in segment 104, and being attached to end 122 of segment 106, such that roller 101 turns and moves up and down, to perform the paint job.

In the claims:

Kindly amend claim 1 as follows:

1. (Thrice amended) A motion transmission and multiplication system comprising:

at least first and second hand-movable elements each having anterior and posterior ends, said elements extending in the same orientation, each element having at least one point thereon connectable to a tool or other object; and

at least a first means linking said first and second elements and being movable with respect to at least one of them, said first linking means also being connectable to an additional element;

said first linking means being arranged on said elements such that when said first linking means is moved with a controllably reversible driving motion with respect to either of said anterior and posterior ends of a selected reference one of either of said first and second elements, wherein said driving motion is in a direction in-line with said orientation,

then said first and second elements, and if connected, said additional element are simultaneously provided with a controllably reversible and multipliable, non-gravity dependent, linear-to-linear

driven motion with respect to each other in-line with said orientation,

said driven motion being in the same direction as said driving motion, or reverse thereto, in accordance with which reference one of said first and second elements was selected in respect of said driving motion.

Kindly delete claim 4 without prejudice.
